

MILAN

SBR MILAN

DESCRIPTION

POLYBOND - SBR Single-component styrene-butadiene rubber anchor liquid stabilizer. designed to improve the physical properties of mixtures Cement.

USES

POLYBOND - SBR is designed for the following uses:

- Anchor agent between old and new concrete layers.
- To produce many types of traditional cement mortar such as cement mortar used in brickwork, masonry, and tile adhesives.
- Forming a mechanical joint before applying the concrete to the concrete and brick surfaces.

FEATURES

- Improving the adhesion and bonding forces of concrete mixtures.
- A highly effective fluid to improve the POLYBOND - SBR is designed for the following uses:-Anchor agent between old and new concrete layers. -To produce many types of traditional cement mortar such as cement mortar used in brickwork, masonry, and tile adhesives. -Forming a mechanical joint before applying the concrete to the concrete and brick surfaces. functionality and consistency of concrete mixtures.
- Improve the physical and mechanical. properties of mixtures such as tensile and bending strength and adhesion forces.
- Increase the resistance of mixtures to repeated freezing and thawing cycles.
- Free from chloride

HOW TO USE

Prepare the surface It is necessary to make sure starting that all surfaces to which the material is to be applied are clean free of any contaminants, provided that the loose layers are treated, on surfaces with suitable acidic materials. In the case of reinforced structural elements, the reinforcing steel must be cleaned openly with sand-tossing or with a wire brush in order to ensure that it is free Bars of any contaminants or impurities. To fix the defects of the concrete layers (patchwork), you must first cut the area to be fixed with a thickness of at least 10 mm to avoid surface repairs. Just make sure that all surfaces are completely wet with water before repairing them.
